

Savanna Virtual Reality

Immersive and personalized virtual experiences

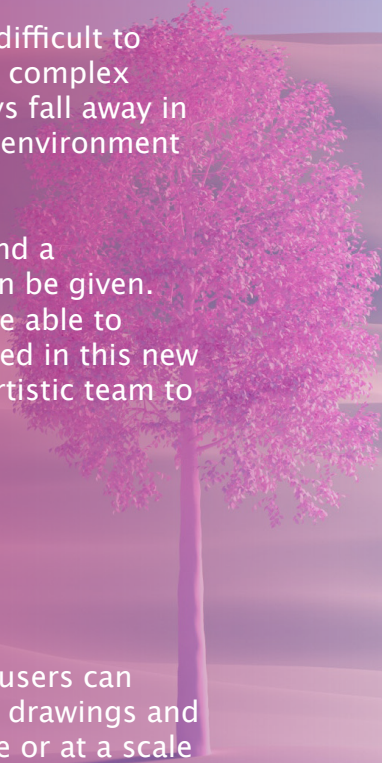

Virtual Reality?

A project can be either small or large but will always be as difficult to present. For example, new buildings or a small change to a complex system. This is because the details and true scale will always fall away in a two dimensional environment. Therefore, a virtual reality environment is the perfect environment to show this.

In this digital world scales can be increased or decreased and a realistic example of a future, previous or current project can be given. With a Savanna Virtual Reality project your customers will be able to really step into a new world. They will become fully immersed in this new but realistic world will be tailor made by our experienced artistic team to reflect the desired world.

A perfect digital world

It is possible to create a completely realistic world that the users can fully relate to. This world will be created using other digital drawings and files. We can also create a world that cannot exist in real life or at a scale where the user can never enter such as the inside of a car engine or an old castle.

Options

Savanna Virtual Reality is available in the following different packages. All three of these packages contain a unique addition to a project and really add something special to the project.

Basic experience

The basic experience is just that, an experience. In this standard variant, the user can walk around in a unique digital environment. This environment will be made completely to your liking. This can be either realistic or unrealistic. Moving elements and simple text elements can also be shown here to explain more. An example would be a digital museum or exhibition.

~ €3.500

Advanced experience

The advanced experience will be even greater in interaction and experience in addition to the components of the basic experience. This version will include interactive elements such as video screens, slide shows, web pages and more. Also, this version will include hands that really interact with the environment and allow the user to pick things up.

~ €7.500

Immersive experience

To create a truly unique experience, the immersive experience is the way to involve users in the presentation or project. In addition to this experience containing all the components of the other experiences, the users can also talk to each other and see each other in the digital environment. This allows for a digital guide to walk with them or for the users to move through this together. It is also possible to make the digital environment exactly as large as the digital world so that the user can walk around without a controller.

~ €16.000

It is of course possible to mix parts of the experiences with each other. This can be discussed directly with Savanna Developments.

Hardware availability

Savanna Virtual Reality works using the Oculus Quest 2. A standalone and moderately priced virtual reality headset. This headset can be configured in a simple to use way allowing you to focus on the experience with minimal effort. With a powerful internal battery you don't need to keep the headsets charged so the users can move everywhere.

We provide two ways to acquire these headsets tailored for your use. The primary option is to acquire these headsets from us for a flat price. We will configure these headsets and provide a proper instruction manual on how to operate, clean and charge these headsets. This allows you to bring these headsets everywhere with maximum freedom (please note that the immersive experience has some limitations which need to be discussed). It is also possible to rent these headsets from Savanna Developments directly, however the availability is very limited and requires you to make a proper appointment in advance.
